

Crowns for Teeth Penticton

A tooth crown, also known as a cap, can be applied to help strengthen and protect a tooth's anatomy that can't be restored with fillings or other dental restorations. They are designed to envelop the total exterior of a tooth and restore it to its initial functioning.

There are some distinctive variations of dental crowns on the marketplace with ceramic tooth-coloured crowns being the most popular due to their similarity to natural teeth. They are really resilient and can last for many years, however like many dental restorations, they may ultimately need to be replaced. Ceramic crowns are made at a dental workshop to match the dimensions, profile, and colour of your teeth lavishing you an attractive and long-term natural smile.

Crowns are most often employed as an answer to cracked or broken teeth, an aesthetic enhancement, to cover an endodontic therapy, to cover a fractured filling, or to replace large fillings.
