

Cosmetic Dental Implants Penticton

Dental implants are false teeth (generally titanium) and fake roots that are surgically inserted into the lower and upper jawbone by an oral health care professional or Periodontist. The false teeth that are attached to the implant are extremely organic looking and are typically utilized to rebuild or enhance a patient's smile! Implants are an exceptional option for clients with missing teeth or those who need fixed or removable partials and full dentures. Tooth implants provide greater durability and reinforcement for these dental appliances.

Implants supply an aesthetically appealing look with a high-degree of stability, durability, and strength. Every so often however, they might require re-tightening or to be replaced due to regular wear.

Typically, implants are used to replace missing teeth, to restore or enrich facial tissues, to problems with the bite or joint pain brought on by the drifting of teeth, to assist any speech impairments, digestion concerns, chewing difficulties, or to enhance a patient's smile. Another motivation to use an insert is for the support of a denture or fixed bridge to make them more secure and comfortable.
