

## Cosmetic Gum Surgery Penticton

Examinations of the periodontal tissues could be accomplished with pictures taken at some point in the first dental visit. In order to fabricate an organic smile, gum tissues should be symmetrical in the mouth. This aesthetic viewpoint looks at natural gum heights, particularly in the anterior area.

There are two diverse therapies oral health care providers utilize to level out the periodontal tissues. The first is a periodontal lift and the second is the gum graft. The gum lift involves removing gum tissues to even out both sides of the mouth. The gum graft on the other hand requires the addition of periodontal tissues to a region that has serious gum recession or a weak root structure. This will help cover the tooth while also evening out the periodontal tissues around the adjacent teeth.

A periodontal technician labeled a Periodontist might be needed to carry out the therapies based on how extensive the work required is. Healing time tends to take approximately three to twelve weeks. Note - these operations might be required prior to the installation of any veneers or crowns.
