

Dentist Veneers Penticton

Created of really thin pieces of ceramic porcelain, veneers are very durable dental fixtures that are custom made in a dental laboratory to resemble your current teeth in both colour and shape. They are cemented onto the front side of your teeth to help create an alluring and beautiful smile. Veneers may be used to completely refashion your smile and teeth. Furthermore, they can often be employed as alternatives to tooth crowns and may produce a perfect solution in treating some oral health ailments.

Veneers are not lasting options and could need replacement after some time due to routine wear and tear. Still, these fixtures are very durable and may last for several years.

Porcelain veneers can be utilized aesthetically, to fashion a uniform, white, beautiful smile, to treat crooked or misshapen teeth, to treat severely discoloured or stained teeth, to balance teeth that are too large or too small, to fill uneven or unwanted spaces, or to aid chipped or worn teeth.
