

Penticton Orthodontist

The positive aspects of orthodontic therapy can extend past the physical changes of straighter teeth and an improved bite, directly into areas of superior self esteem and amplified personal self-impression. Although aesthetic attractiveness to having beautiful straight teeth is valuable, the most significant need is to alleviate any prospective oral health worries associated with the teeth or jaw. Having jaw issues or crooked teeth may contribute to poor cleaning methods, which can cause oral cavities or even gum disease or total tooth loss. Orthodontic concerns that remain neglected can lead to digestion and chewing difficulties, speech impediments, and uneven wear on the surfaces of the teeth. Over time, too much tension on the periodontal (gum) structures and the supporting bones of the teeth can impact the jaw joints resulting in troubles such as neck and face pain or headaches.

There have been many advancements in orthodontics, so wearing braces has never been less complicated. Mouth appliances come these days in many different types; from lingual braces which fasten to the rear of the teeth, to clear braces, to traditional metallic braces. Numerous individuals may even be candidates for alignment with Invisalign, a revolutionary solution to straighten teeth using clear, retainer type aligners that need no wires or braces.

There are several reasons why orthodontic treatment could become an alternative for you and they consist of an underbite, a crossbite, a deep overbite, or an overjet. A crossbite happens when a number of upper arch teeth bite on the inside of the lower arch teeth. A deep overbite involves the bottom front teeth biting into the tissues of the top teeth. An overjet issue signifies that the top arch teeth protrude beyond the shorter lower jaw. Finally, an underbite or lower jaw protrusion happens when the lower jaw is longer than the top jaw.

Occasionally, orthodontic braces are a great alternative when you have difficulties swallowing, biting, chewing or speaking. Many patients may require dental orthodontics to treat concerns such as mouth and face disfiguring or jaw joint pain.

Cosmetic or aesthetic reasons for considering orthodontic therapy could take account of poor spacing of the teeth, extra or missing teeth, crowded teeth, or the reasons might merely involve the enhancement of total self image to enhance a individuals self confidence.
